

The IBM Travelling Pavilion lies among one of Peter Rice's accomplishments such as the Sydney Opera House, Lloyds building and the Pompidou Centre. The pavilion was designed to maximise functionality and portability while maintaining a simple design. This was achieved by prefabricating the various elements of the building to minimise onsite assembly and using repetitive bays to minimise simplify the design. The structure was a series of 3 pin arches that were bolted to the floor of the building. There is also a set of outer arches fixing the poly carbonate pyramids back to the inner frame. Polycarbonate was used as the main cladding element but also structurally.

# IBM PAVILION

Renzo Piano 1980-1984

## Further Development - MoMI Pavilion 1992
